About this Series

“Lecture Notes in Electrical Engineering (LNEE)” is a book series which reports the latest research and developments in Electrical Engineering, namely:

- Communication, Networks, and Information Theory
- Computer Engineering
- Signal, Image, Speech and Information Processing
- Circuits and Systems
- Bioengineering

LNEE publishes authored monographs and contributed volumes which present cutting edge research information as well as new perspectives on classical fields, while maintaining Springer’s high standards of academic excellence. Also considered for publication are lecture materials, proceedings, and other related materials of exceptionally high quality and interest. The subject matter should be original and timely, reporting the latest research and developments in all areas of electrical engineering.

The audience for the books in LNEE consists of advanced level students, researchers, and industry professionals working at the forefront of their fields. Much like Springer’s other Lecture Notes series, LNEE will be distributed through Springer’s print and electronic publishing channels.

Solar Simulator Using Halogen Lamp for PV Research

Aryuanto Soetedjo, Yusuf Ismail Nakhoda, Abraham Lomi and Teguh Adi Suryanto

Abstract This paper presents the development of solar simulator using the halogen lamp for PV research. The proposed simulator simulates both the irradiation level and the movement of the sun. The sun irradiation was simulated by varying the brightness of halogen lamp using a lamp dimmer controlled by the microcontroller. While the sun's movement was simulated by rotating the lamp on a frame actuated by a DC motor. A computer was employed to control the simulator in the manual mode where the user could input the desired position and irradiation level of the sun, or in the automatic mode where the desired position and irradiation level were calculated automatically based on the predefined data. The experimental results show that the proposed simulator works appropriately in simulating the sun's movement while varying the irradiation level. The average error of irradiation measurement between the sun and the solar simulator was 7.196 %.

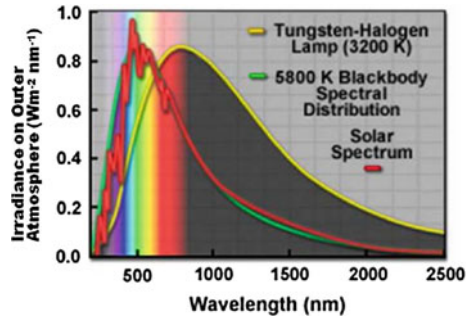

Keywords Halogen lamp · Irradiation level · Solar simulator · PV

25.1 Introduction

Nowadays, the renewable energy resources, such as the PV system is widely used. The research and development of the PV system increase significantly. Naturally, the experiments on PV system require the sun light. Therefore, to provide the flexibility of testing and validating the PV system, the solar simulator was utilized [1–6]. The solar simulator uses the different kind of light sources such as carbon arc lamp, metal oxide arc lamp, quartz halogen lamp, xenon arc lamp, mercury xenon lamp, argon arc lamp, and LED (Light Emitting Diode) to simulate the solar lighting [6]. The halogen lamp is widely used due to inexpensive and the excellent

Fig. 25.1 Halogen lamp spectrum distribution [4]

light output [4]. However it radiates the weak output in the blue and ultraviolet spectrum and strong output in infrared spectrum as illustrated in Fig. 25.1.

A simple solar simulator using the halogen lamp was developed in [5]. The developed solar simulator was used to measure the I-V characteristic of the PV module. In the experiments they changed the distance between the lamp and the PV module to vary the irradiation level. The irradiation level of 1 Sun (1000 Watt/m^2) was achieved when the distance is 80 cm with the 4000 W halogen lamp.

The LED based solar simulator was developed in [2]. The objective of their research is to match the spectrum of solar simulator according to the ASTM E927-05 Standard Specification for Solar Simulation for Terrestrial Photovoltaic Testing. They used five types of high power LEDs having the wavelengths of 470, 505, 530 and 655 nm, and white color. The spectral matching was carried out by controlling the intensity of LEDs using the PWM signal controlled by a microcontroller.

The combination of halogen lamp and LED for solar simulator was proposed in [1, 3]. The advantages of LED are the high efficiency and low cost. But for NIR (Near Infra Red) spectrum, the emission band is narrow and very expensive. Therefore, they used the halogen lamp to replace the LED in the NIR spectrum.

In this paper, we propose a simple solar simulator using the halogen lamp. Our proposed solar simulator has two main contributions, i.e.: (a) It provides the varying irradiation by changing the lamp intensity; (b) It simulates the movement angle of the sun from rising time in the morning until sunset time in the afternoon. The computer software is utilized to operate such system in the automatic mode and manual mode.

The rest of paper is organized as follows. Section 25.2 presents the proposed system. Section 25.3 presents the experimental results. Conclusion is covered in Sect. 25.4.

25.2 Proposed System

The block diagram of proposed system is illustrated in Fig. 25.2. It consists of a computer, a microcontroller unit, a servo motor, a dimmer unit, a DC motor, a halogen lamp, and the mechanical parts. The computer is used by the user to control

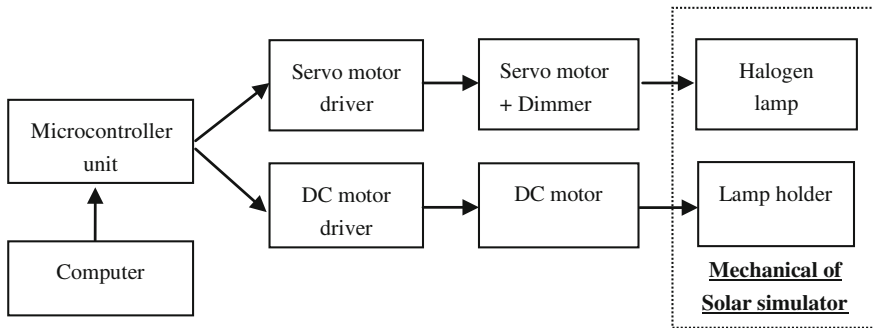

Fig. 25.2 Block diagram of solar simulator

the solar simulator. The microcontroller unit is employed for interfacing between the computer and the motors. It receives the command for rotating the DC motor and servo motor from the computer. The DC motor is used to rotate the lamp frame for simulating the sun rotation. The motor is equipped with the gear reduction and is driven by the driver that provides the high current.

The dimmer unit is a device used to control the light intensity of the lamp. Commercially, the dimmer is equipped with a potentiometer for adjusting the lamp intensity. In the research, we adopt the existing dimmer by modifying it with a servo motor coupled with the potentiometer. Using this arrangement, the rotation of potentiometer could be controlled by the microcontroller.

The halogen lamp is installed on a rotating frame that moves 180° from the left to right, vice versa. The rotating frame is installed above the base where the PV module is placed. Using this construction, we could simulate the movement of sun rising and sunset by moving the rotating frame controlled with the DC motor.

In the research, the solar simulator is designed to simulate the sun rotation from 07:00 until 17:00. In this experiment, the start position of halogen lamp is set to 15° , and the final position is set to 165° . Therefore the position of 90° is achieved when the lamp is located in the above middle of the PV module. This position represents the position of the sun at noon (12:00).

The computer software is designed to control both the lamp position and brightness. Two modes are available, i.e. manual mode and automatic mode. In the manual mode, the user enters the lamp position and the required irradiation level. In the automatic mode, the system will run automatically by reading the predefined values of lamp position and the corresponding irradiation level.

25.3 Experimental Results

The hardware of proposed solar simulator is illustrated in Fig. 25.3. Several experiments are conducted to validate the proposed system. In the first experiment, the relationship between the potentiometer position (i.e. the servo position) and the

Fig. 25.3 Hardware of solar simulator

brightness level represents the irradiation level is observed. To measure the irradiation level, the Solar Power Meter (Tenmars TM-206) is employed. The measurement result is given in Table 25.1 and Fig. 25.4. From the figure, it is clearly shown that the relationship is almost linear. Thus the irradiance level for a certain value could be determined easily based on the position of servo motor.

From the table, the relationship between servo position and irradiation level could be expressed using the following equation

$$y = 8.204x - 334.6 \tag{25.1}$$

where, y is the irradiation level in Watt/m^2 and x is the servo position in degree.

In the second experiment, we compare the irradiation level of the sun and the solar simulator. At first, the sun irradiation level is measured from 07:00 until 17:00 with 15 min interval. This measurement is conducted during the sunny day. The measurement result is listed in Table 25.2. Then the solar simulator is run in the

Fig. 25.5 Comparison of Sun irradiation versus solar simulator irradiation

automatic mode. Thus it will rotate and vary the brightness of halogen lamp automatically. During this movement, the irradiation level of the simulator is measured and listed in Table 25.2.

Figure 25.5 illustrates the measurement results of the irradiation level of the sun and the solar simulator. From the figure, it is obtained that the result of the solar simulator is almost the same with the sun. The error between the real measurement of the sun irradiation and the solar simulator is calculated as

$$\frac{|Lamp\ irradiation - Sun\ irradiation|}{Sun\ irradiation} \times 100\% \tag{25.2}$$

From the table, the average error for the data given in Table 25.2 is obtained as 7.196 %.

Two important results are achieved by our proposed system. The first is a method to change the lamp intensity by utilizing the the simple lamp dimmer coupled with the servo motor. This simple arrangement offers the linear relationship between the servo position and the irradiation level produced by the halogen lamp. The second is the capability of the proposed system to simulate the irradiation level generated by the sun during the sunny day. It is validated by the experiment that the proposed solar simulator is able to move while varying the lamp intensity closely to the real sun.

25.4 Conclusion

The simple and low cost solar simulator is developed. The main objective of the proposed simulator is to simulate the sun irradiation and the sun movement. The solar simulator could be used to examine and test the research on PV system. The irradiation of solar simulator could be controlled using the computer and almost the same as the real measurement of the real sun irradiation.

In future, the simulator will be extended in the size which is used by the larger PV module. Further the software simulation will be improved and integrated with the PV system.
