Welcome Message

It is our great privilege to welcome you to the 2015 International Conference on Automation, Cognitive Science, Optics, Micro Electro-Mechanical System, and Information Technology (ICACOMIT 2015) held in Bandung, West Java, Indonesia, October 29 - 30, 2015. ICACOMIT 2015 is organized by Research Group of Technical Implementation Unit for Instrumentation Development, Indonesian Institute of Sciences (UPT BPI-LIPI) and Technical Co-sponsored by the IEEE Indonesia Control Systems Society (CSS) & Robotics and Automation Society (RAS) Joint Chapter. We are confident that ICACOMIT 2015 will provide a forum for fruitful interaction and exchange of ideas between the participants coming from around the world. The aim of these international conferences is to promote interaction among engineers, researchers, and scientists active in the related areas of the conferences. The events are intended to provide a high level international forum to exchange, and to discuss recent advances in the field of automation, cognitive science, optics, micro electro-mechanical system, and information technology.

No conference can be successful without excellent teamwork. Our special appreciations go to the sacrifices and perspirations of our colleagues and organizing committee members. Our special thanks also goes to all individuals and organizations such as the international program committees (IPC), the reviewers, and the authors, for their contribution in making ICACOMIT 2015 not only a successful international conference but also as a memorable gathering event. We hope this conference will benefit all of us in advancing research activities and building new friendship. We are truly grateful for your contribution and interest to the conferences.

Best regards, Arjon Turnip, Ph.D. General Chair of ICACOMIT 2015

Contents

| <u>CONTENTS</u> | : |
|---|---|
| PROGRAM AT A GLANCE | 1 |
| PLENARY SESSION | 20 |
| Brain-Machine Interface via Light | 2 |
| Prof. Keum-Shik Hong, Ph.D. (School of Mechanical Engineering, Pusan National University, Korea) | 2 |
| Smart Needle System for Robotics Surgery | 2 |
| Parsaoran Hutapea, Ph.D. (Department of Mechanical Engineering, Temple University, Philadelphia, Pennsylvania) | 2 |
| Intelligent Sensing: From Macroscopic to Microscopic Scale | 2 |
| Poki Chen (National Taiwan University of Science and Technology, Taiwan) | 2 |
| ABSTRACTS | 2 |
| Effect of Flow Force in the Characteristics of Electrohydraulic Servovalves | 2 |
| lwan Istanto (Pukyong National University, Korea), Kim Hyun Ho (Pukyong National University, Korea), Ji Sang Won (Pukyong National Universi | ty, |
| Korea), Lee III Yeong (Pukyong National University, Korea), Kim Sang Ho (SG Servo, Korea), Lee Hyeon Cheol (SG Servo, Korea) | 2 |
| Embedded Sensor Fusion and Moving-average Filter for Inertial Measurement Unit (IMU) on the Microcontroller-based Stabil | ized |
| <u>Platform</u> | 2 |
| Grace Gita Redhyka (Indonesian Institute of Sciences, Indonesia), Dika Setiawan (Indonesian Institute of Sciences, Indonesia), Demi Soetraprav | vata a |
| (Indonesian Institute of Sciences, Indonesia) | 2 |
| Hilman Svaeful Alam (Indonesian Institute of Sciences, Indonesia) | 2 |
| Non-Contact Portable Infrared Thermometer for Ranid Influenza Screening | 2 |
| Daniel Santoso (Satva Wacana Christian University, Indonesia). Dalu Setiaii (Satva Wacana Christian University, Indonesia) | 2 |
| Multi Objective Optimization of the Structural Design of Double End Beam Load Cell | 2 |
| Hilman Svaeful Alam (Indonesian Institute of Sciences, Indonesia). Bahrudin (Indonesian Institute of Sciences, Indonesia). Demi Soetraprawata | _ |

2015 INTERNATIONAL CONFERENCE ON AUTOMATION, COGNITIVE SCIENCE, OPTICS, MICRO ELECTRO-MECHANICAL SYSTEM, AND INFORMATION TECHNOLOGY

October 29th-30th,2015 | Aston Tropicana Hotel, Bandung, Indonesia

This conference aims to bring together leading academic scientists, researchers and research scholars to exchange and share their experiences and research results about all aspects of Instrumentation Control, Automation, Cognitive Science, Optics, Micro Electro-Mechanical System, and Informatics and Information Technology. It also provides the premier interdisciplinary and multidisciplinary forum for researchers, practitioners and educators to present and discuss the most recent innovations, trends, and concerns, practical challenges encountered and the solutions adopted in those field. Topic of interest for submission include, but are not limited to:

Instrumentation Control and Automation

Adaptive Control; Robust Control; Process Control; Complex Systems; Co-Operative Control; Identification and Estimation; Nonlinear Systems; Intelligent Systems; Discrete Event Systems; Hybrid Systems; Networked Control Systems; Sensor Networks; Delay Systems; Neural Networks; Fuzzy Systems; Control of Biological Systems; Precision Motion Control; Control Applications; Control Engineering Education; Process Automation; Intelligent Automation; Factory Modeling and Simulation; Home, Laboratory and Service Automation; Network-Based Systems; Planning, Scheduling and Coordination; Nano-Scale Automation and Assembly; Instrumentation Systems.

Cognitive Science and Technology

Cognitive and Computation Models; Human Reasoning Mechanisms; Modeling Brain Information Processing Mechanisms; Brain Learning Mechanisms; Human Cognitive Functions and Their Relationships; Modeling Human Multi-Perception Mechanisms and Visual, Auditory, and Tactile Information Processing; Neural Structures and Neurobiological Process; Cognitive Architectures; Brain Information Storage, Collection, and Processing; Formal Conceptual Models of Human Brain Data; Knowledge Representation and Discovery in Neuroimaging; Brain-Computer Interface; Cognition-Inspired Complex Systems; Expert Systems, Knowledge Representation and Reasoning; Reasoning Techniques, Constraint Satisfaction and Machine Learning; Logic Programming, Fuzzy Logic, Neural Networks, and Uncertainty; State Space Search, Ontologies and Data Mining; Games, Planning and Scheduling; Natural Languages Processing and Advanced User Interface; Cognitive, Reactive and Proactive Systems; Ambient Intelligence, Perception and Vision; Pattern Recognition.

Optics

Fiber Optics; Biomedical Optics; Computational Optical Sensing and Imaging; Optical Instrumentation; Optics in Astronomy and Astrophysics; Spectroscopy, Imaging and Metrology; Optical Communications and Networking; Artificial Vision; Photorefractive Effects, Materials, and Devices; System Reliability and Security; Optical Materials; Display Technology; Organic and Bio-photonics; Nanophotonics; Microwave Photonics; Power Photonic; Photonics and Optoelectronic Materials and Devices; Photonic in Communications and Switching; Ultrafast Electronics, Photonics and Optoelectronics; Green Photonics; Photodetectors, Sensors and Imaging; Nonlinear Optics; High Intensity Lasers and High Field Phenomena; Quantum Electronics and Laser Science; Quantum Information and Measurement; Biomedical and Therapeutic Laser Applications; Optoelectronics; Laser Microscopy; Fiber Lasers and Applications; Waveguide Lasers; Semiconductor Lasers and LEDs; Weapons and Military Technology; Plasma Technologies.

Micro/Nano Electro-Mechanical System

Smart Material, Design, Simulation and Analysis Tools with Experimental Verification; Fabrication Technologies and Processes; Silicon and Non-Silicon Materials; Electro-Mechanical Integration Techniques; Assembly and Packaging Approaches; Metrology and Operational Evaluation Techniques; System Architecture, Microfluidic and Nanofluidic Devices; Lab-on-Chip and Biochemical Sensors; Medical Microsystems, for Example Probes, Implantables, Minimally Invasive Devices; Physical Sensors; Electromagnetic Transducers; Microactuators; Microdevices for Power Supply and Energy Harvesting.

Informatics and Information Technology

Machine Learning and Data Mining; Classification and Clustering; Multi-resolution Techniques; Information Retrieval; Evolution Strategies; Genetic Programming and Evolutionary Programming; Computer Vision and Image Analysis; Intelligent Image, Signal, and Speech Processing; Information Systems; Mobile Computing; Multimedia Applications; Natural Language Processing; Parallel and Distributed Computing; Performance Evaluation; Programming Languages; Re-configurable Computing Systems; Security & Cryptography; Automated Software Engineering; Bioinformatics; Computer Architecture & VLSI; Computer Architecture and Embedded Systems; Computer Games, Graphics & Virtual Reality; Computer Modeling; Computer Networks and Security; Computer Vision; Computer-aided Design/Manufacturing; Computing Ethics; Data Communications, Compression and Encryption; Data Mining; Databases; Digital Library; Distributed Systems; Event Driven Programming; Expert Systems; High Performance Computing; Theoretical Computer Science; User Interface; Dilution of Organizational Boundaries; The centrality of Information System (IS) and IT in Organizational Processes; Innovation and IS; Enterprise Application Integration; Enterprise Resource Planning; Business Process Change; Iterative and Incremental Methodologies; Agile Methodologies; E-Learning and Teaching.

Conference Organization

General Chair Arjon Turnip, Indonesian Institute of Science, Indonesia

Co-General Chair Augie Widyotriatmo (Institute of Technology Bandung, Indonesia)

Technical Program Chair Endra Joelianto (Institute of Technology Bandung, Indonesia) Secretary Chair Hanif Fakhrurroja (Indonesian Institute of Science, Indonesia) Treasury Chair Hilman Saeful Alam (Indonesian Institute of Science, Indonesia) Publication Chair Muhammad Ary Murti (Telkom University, Indonesia) Publicity Chair Anto Tri Sugiarto (Indonesian Institute of Science, Indonesia)

Development of PV Simulator by Integrating Software and Hardware for Laboratory Testing

Aryuanto Soetedjo*, Yusuf Ismail Nakhoda, Abraham Lomi, Gunawan Eko Hendroyono

Department of Electrical Engineering National Institute of Technology (ITN) Malang, Indonesia *aryuanto@gmail.com

Abstract—This paper presents the development of PV (photovoltaic) simulator used for laboratory testing. The proposed simulator integrates both the software and the hardware devices. The aim of the proposed simulator is to develop an instrument that provides the output electrical power which is determined by the characteristic of PV under the varying solar irradiation. The Simulink software is employed to model the I-V characteristic of the PV. The output of Simulink is interfaced to a microcontroller for adjusting the current of an adjustable DC power supply. The experimental results show that the proposed simulator works appropriately, in the sense that power delivered by the adjustable power supply follows the maximum output power determined by the solar irradiation simulated in the Simulink. Further, the output of PV simulator could be connected to real electrical load for laboratory testing.

Keywords—PV simulator; Simulink; adjustable power supply; laboratory testing.

I. INTRODUCTION

Nowadays, the researches on renewable energy resources increase significantly. The PV is one of the renewable resources widely used in the market. For laboratory testing, it is common for researchers to use the PV simulator for evaluating and validating the experiments related to the PV systems. There are two types of PV simulator: a) Using the software [1], [2], [3], [4], [5], [6], [7]; b) Using the hardware devices [8], [9], [10]. The advantages of simulation software are: a) It could be simulated easily on the computer; b) The complex models or techniques could be developed; c) The simulation time could be controlled accordingly. While one major drawback is that the simulator could not be implemented in the real application.

Contrary to the simulation software, the simulation hardware provides the real implementation. It could be connected directly into the electrical power network. However, due to the hardware complexity, the PV models that could be implemented are limited.

In the simulation software, the PV was simulated using the simple models [1], [2], [4], [6], [7] or the detailed models [3], [5]. The models are usually implemented using the Matlab/Simulink software. The PV model describes the characteristic of I-V (current-voltage) under the varying solar

irradiation and temperature. In [1],[2],[7] the PV was modeled by a current source in parallel with a diode and simulated using the Matlab. The model in [1] was used to compare several MPPT (Maximum Power Point Tracking) topologies. The diode connected in series with the resistor was employed as the PV model in [4]. They proposed the simple PV model in order to apply the model to the circuit simulator software. The model is very simple and no iteration process is involved.

The PV model by considering the environment conditions such as solar irradation, and wind speed was proposed in [5]. They compared the model with the different PV technologies such as monocrystalline silicon, polycrystalline silicon, and thin film. The performance of the model is good when compared to the monocrystalline silicon and thin film, but it is poor when compared to the polycrystalline silicon.

The simple PV model developed in Matlab was used to simulate the energy resource for the Smart Grid simulation [6]. The PV model is a sub-system from the whole system consists of the wind generator, the main grid, the distribution line and the loads.

In the simulation hardware, the real PV module is eliminated by emulating it using an electronic circuit. In [8], a real-time PV simulator was developed using the Field Programmable Gate Arrays (FPGAs). The simulator consists of two main components, i.e. the switched-mode DC/DC converter and the control system. The control system generates the PWM (Pulse Width Modulation) signal to control the output voltage of the DC/DC converter according to the look-up table of I-V characteristic which is stored in FPGA unit. The user could select the solar irradiation level and cell temperature to simulate the operating condition of PV generator.

In [9], [10], the microcontrollers were used to calculate the PV characteristic and to control the DC-DC buck converter for simulating the PV generator. The look-up table was adopted to store the I-V curve [9]. The algorithm to calculate the I-V characteristic was implemented on the microcontroller [10].

In this research, we propose the PV simulator by combining the software and the electronic hardware. Compared to the existing systems, our proposed method has the benefits such as: it is able to simulate the complex model

978-1-4673-7408-8/15/\$31.00©2015 IEEE

by the software and the realistic simulation could be performed by the hardware. The Simulink software is employed to simulate the I-V characteristic of PV under the varying solar irradiation. Using the model, the power output of PV is calculated. Based on this output power, the Simulink controls the current of adjustable DC power supply to adjust the desired output power. Thus the maximum power delivered by DC power supply follows the power generated by the PV model.

The rest of paper is organized as follows. Section 2 presents the architecture of proposed system. Section 3 describes the implementation of proposed system. Section 4 presents the experimental results. Conclusions are covered in Section 5.

II. PROPOSED SYSTEM

The aim of proposed simulator is to generate the electrical power in which the maximum output power is determined by the solar irradiation. For instance, when the solar irradiation is 1 Sun, then according to the PV model (I-V characteristic), the PV output is assumed as 50 Watt. Thus the maximum output power of the simulator should be 50 Watt.

The architecture of PV simulator is illustrated in Fig. 1. It consists of the software part and the hardware part. In the simulation software part, the Simulink software is employed to simulate the PV as explained in the next section. The output of simulation software is used to control the hardware part, i.e. the adjustable power supply via the microcontroller. The microcontroller is selected as the interfacing device because of the capability to communicate with the Simulink easily. The serial communication line is employed to communicate between the Simulink and the microcontroller.

Fig. 1. The architecture of PV simulator.

The main components of the hardware part are: a) Microcontroller; b) Current and voltage sensors; c) Adjustable power supply; and d) Servo motor. The Arduino microcontroller is employed to interface between the Simulink and the adjustable power supply. To provide the simplicity, the popular IC LM723 is employed as the main component of adjustable power supply. Using this component, the current of

the power supply could adjusted by a potentiometer. Then the power supply module is modified by adding a servo motor to control the rotation of the potentiometer.

The rotation of servo motor is controlled by the Arduino microcontroller according to the control algorithm computed by the Simulink. The current and voltage sensors are employed to read the current and voltage of the adjustable power supply. These parameters are sent to the Simulink for calculating the proper position of the servo motor.

III. IMPLEMENTATION

A. Simulink Model of PV Generator

The PV generator is modelled as illustrated in Fig. 2, where the output current (I_L) depends on the solar irradiation (G) and the cell temperature (T) [1]. The model uses the parameters listed in Table 1, which is the typical PV characteristic for 50 Watt PV module.

Fig. 2. The equivalent circuit of PV model [1].

| TABLE I. | PV CHARACTERISTIC [7] |
|----------|-----------------------|
| Variable | Level |
| Pmax (W) | 50 ± 5% |
| Vpm (V) | 17.5 ± 5% |
| lpm (A) | $2.86 \pm 5\%$ |
| Voc (V) | 21.5±5% |
| Isc (A) | $3.25 \pm 5\%$ |

The PV module is modeled using MATLAB function block as illustrated in Fig. 3. The PV block has three inputs, i.e. the PV voltage, the solar irradiation, and the temperature. The output of the PV block is the PV current. In the experiment, two PV modules are connected in parallel as shown in the figure.

Fig. 3. The simulink model of PV model [7].

The complete Simulink model of the proposed system is illustrated in Fig. 4. The upper part is the Simulink model of

PV model, while the lower part is the model for interfacing to the microcontroller. Thank to [11] which provides the MATLAB package to support the Arduino microcontroller. The interfacing between Simulink and Arduino microcontroller involves the voltage reading, the current reading, and the servo motor control.

As illustrated in the figure, the input voltage of PV module is taken from the voltage sensor read by the microcontroller (Pin-5 of the Arduino microcontroller). The output of PV module, i.e. PV power is used to control the position of motor servo. This position corresponds to the current limit of the adjustable power supply. From the experiment, it is obtained that the servo position (in degree) is given by multiplying the PV power (in Watt) by 2.2.

Fig. 4. The Complete Simulink model of PV Generator.

B. Adjustable Power Supply

The block diagram of adjustable power supply interfaced to the microcontroller is illustrated in Fig. 5. It employs the low cost IC LM723 as the main component for adjusting the voltage and current of the power supply. The potentiometer for current adjustment is coupled by a servo motor which is controlled by the microcontroller.

Since the LM723 provides a small current, the current booster is required to generate the higher output current about 5 Ampere. The servo motor is attached to the potentiometer so it will rotate the potentiometer from the minimum position to the maximum position, where the minimum position corresponds to the servo position of 0^{0} and the maximum position corresponds to the servo position of 180^{0} . Fig. 6 illustrates the picture of the adjustable power supply.

Fig. 5. Block diagram of the adjustable power supply.

Fig. 6. Picture of the adjustable power supply controlled by the servo motor.

IV. EXPERIMENTAL RESULTS

Several experiments are conducted to verify the proposed simulator. In the experiments, the PV Generator (Simulink + adjustable power supply) is connected to the AC load using DC/AC power inverter. The objective of experiments is to verify that the power delivered by the adjustable power supply should not exceed the power limit determined by the solar irradiation condition. Two scenarios are examined during the experiments. In the first scenario, the solar irradiation is fixed, while the load power is varied over the time. In the second scenario, the load power is fixed, while the solar irradiation is varied over the time.

The experimental results of the first scenario are illustrated in Fig. 7 and Fig. 8. In each figure, the output voltage, the output current, the output power, and the servo position are shown in the first, second, third and fourth rows respectively.

Fig. 7 shows the result when the solar irradiation is 1 Sun (1000 Watt/m^2) and the load (the incandescent lamp) varies from 0 Watt, 20 Watt, 35 Watt, and 55 Watt. From the figure, it is obtained that the output power follows the load power accordingly. It means that when the solar irradiation is 1 Sun, the maximum power delivered by the PV module is greater than 55 Watt.

Fig. 8 shows the result when the solar irradiation is 0.6 Sun and the load varies from 20 Watt, 35 Watt, and 55 Watt. By observing the figure, when the load power is 20 Watt or 35 Watt, the output power of the simulator follows the load. However, when the load power is 55 Watt, the output power of the simulator is only 44 Watt, i.e. the maximum output power could be delivered by the PV generator under the solar irradiation of 0.6 Sun. It refers to the overload condition, where the load power is greater than the maximum output power could be delivered by the PV.

From the above results, it is concluded that the maximum output power of PV simulator varies according to the solar irradiation. When the load power is lower than the maximum power, the output power of PV simulator follows the load power. When the load power is greater than the maximum power, the output power of PV simulator is the maximum output power for a particular irradiation condition.

It is also observed that the output voltage drops about 0.7 Volt (12.3 Volt – 11.6 Volt) when the load power changes from 20 Watt to 55 Watt. Since the solar irradiation is fixed, the servo position is also fixed. The small deviation is caused by the voltage drop.

The experimental results of the second scenario are illustrated in Fig. 9 and Fig. 10. In each figure, the output voltage, the output current, the output power, the servo position, and the solar irradiation are shown in the first, second, third, fourth, and fifth rows respectively.

Fig. 9 shows the result when the load power is 35 Watt, while the solar irradiation varies from 0.3 Sun, 0.1 Sun, 0.4 Sun, and 0.5 Sun. Observing the figure, it is obtained that when the solar irradiation is 0.5 Sun, the maximum output power is 32 Watt. It follows with the previous experiment, where the output power of 35 Watt could be achieved when the solar irradiation is 0.6 Sun.

Fig. 10 shows the result when the load power is 55 Watt, while the solar irradiation varies from 0.3 Sun, 0.1 Sun, 0.4 Sun, 0.5 Sun, 0.6 Sun, 0.8 Sun. It is noted from the figure that when the solar irradiation is 0.1 Sun, the output fluctuates. It is observed from the experiment that during this time the lamp is flickering. This condition is caused by too much overload, i.e. the maximum output power of PV generator is only 20 Watt, while the load power is 55 Watt.

It is also observed that the output voltage drops about 1.5 Volt (12.3 Volt – 10.8) Volt when the load power changes from 20 Watt to 55 Watt. Compared to the previous result, the value of voltage drop is an important parameter, which could be used to determine the overload condition.

V. CONCLUSIONS

The PV simulator consists of the simulation software interfaced to the adjustable power supply is presented. The output of the simulator is the DC power connected to the electrical load. The PV simulator is tested under varying load power and solar irradiation with a proper result. It behaves like the real PV system connected to the real electrical load.

In future, the system for higher output power will be developed. Futher the integration with the other electrical power systems will be conducted.
